

Project Management and Planning

Gallaway Consulting offers a wide range of project management and planning services to our clients. When necessary to serve client needs, GC works with professionals in geology, civil engineering, archaeology, air quality, acoustical, architecture, etc., to create a successful outcome that provides the client with practical solutions to land development projects.

“Project Management is the discipline of planning, organizing, and managing resources to bring about the successful completion of specific project goals”

Our clients realize real cost savings by utilizing GC pre-project planning. GC has the ability to conduct preliminary or detailed assessments to identify opportunities and constraints to land development. By identifying natural resources and sensitive species early in the planning process, projects can be designed to avoid costly permitting and mitigation requirements.

We regularly coordinate with staff from regulatory agencies, local governments, developments, engineers, land appraisers, and the real estate community to facilitate good communication for our clients.

When mitigation is required for a project GC is able to develop creative solutions to our clients needs through both onsite and offsite mitigation planning and implementation.

GC is premised on client satisfaction through adherence to professional standards, which include thoroughness, objectivity, innovation, open lines of communication and the assurance that our client’s needs and objectives are met in a cost and time efficient manner.

Services Include:

- Opportunities and Constraints Analysis
- Infrastructure Planning
- Mitigation Design and Cost Estimates
- Consistency Review
- Feasibility Analysis
- Management of Sub-consultants
- Specific and General Plans
- Open Space Planning and Mgmt.
